GLUCOSE UPTAKE ASSESSMENT ON RODENT MUSCLES

Key benefits:
• Quickly select your best drug compounds targeting insulin resistance and diabetes with our sensitive radiotracer based glucose uptake assay on rodents' muscles.
• Test your drug dose-dependently, using insulin as positive control.

METHODS

Isolated muscles are incubated with vehicle/test compounds and \(^3\)H-2-deoxyglucose (2-DOG).
2-DOG is up taken but not metabolized by cells, which allows the ex vivo assessment of glucose uptake by isolated muscles.

RESULTS

Dose-dependent evaluation of test compound 1 on muscle glucose uptake, which is markedly increased by insulin.

Glucose uptake assay in wild type mouse muscle (extensor digitorum longus, EDL) incubated with vehicle, test compound 1 or insulin for 30 minutes at 37°C in a medium containing 2DOG*. Data are expressed as mean +/- SEM. #p<0.0001 vs. vehicle.
